Customs eBond Status Notification - Introduction

The Bond Status Notification message is a new ABI message generated from Customs and Border Protection's (CBP) ACE bond processing, from an action transmitted by the bond filer, from an action taken on the bond by CBP, or from a related entry and entry summary action. This message will only be sent to ACE ABI filers for bonds filed in ACE.

The filer of bond and secondary notify parties nominated by the bond filer may receive a Bond Status Notification message indicating that an action has been taken on the bond by the Surety / Surety Agent or by CBP. In addition, the filer of the bond will receive a Bond Status Notification message whenever an action has been taken for an entry, entry summary, or collections activity related to the bond.

Please see the table provided in Note 1 of the B1 Record layout for the complete list of bond status disposition codes, the parties eligible to receive the disposition, and the corresponding source action triggering the notification.

Input: There are no input records for bond status notification messages.

Output: Record Identifier B1 is a bond status notification output record that provides data to identify the bond for which an action has been taken.

Record Identifier B2 is a conditional bond status output record which, if present, will contain the transaction information. This record is not repeated and only applies to the Disposition Codes with the Source of Action Code = 3.

Record Identifier B3 is a conditional bond status output record which, if present, will contain additional remarks from a CBP user. This record may be repeated.

Record Identifiers 10-46 are conditional bond status output records that provide detailed bond information based on the triggering source action. Please see the Output Record Structure Map for the conditions generating these records.

Record Identifiers C1 and P1-P5 are conditional bond status output records that provide detailed entry and post release / entry summary information related to the bond. These records contain entry related status information and will be sent to the filer of the bond (CB Filer), the co-surety filer agents, and the secondary notify parties based on the disposition code. Please see the Output Record Structure Map and Note 1 of the B1 Record for details on usage.

The application identifier in Record Identifier B is BS. For additional information on Record Identifier B, refer to the "ABI Batch & Block Control" chapter of the ACE ABI CATAIR.

Record Layout Key: A new description of the contents of each column of the record layouts has been developed for ACE. Please refer to ACE ABI CATAIR Appendix Q for a description of this new record layout key.

Record Layout Key

The following key describes the columns of the record layout definitions that follow.

Data Element:

Contains the name of the reported data field.

Length:

Indicates the maximum, allowed length of the reported data element.

Class:

Defines the domain of values accepted for the data element. The class definition represents the accepted domain to be used in **all** filing scenarios. Class codes are as follows:

S = Space ONLY.

A = Alphabetic Data. Consists of characters A through Z (uppercase ONLY).

N = Numeric Data Only. Consists of numerals 0 through 9.

(S)N = Numeric Data Variation. May contain '**Numeric Data Only**' **or** may consist of one or more spaces followed by numerals 0 through 9. Must consist of at least one right justified numeral. This variation of numeric class may be used for amounts, rates, and counts (where specified).

AN = Alphanumeric Data. Consists of characters A through Z (uppercase ONLY), numerals 0 through 9, and space.

D = Known Date. Consists of numerals 0 through 9 (format MMDDYY; month, day, year).

X = Special Data. Consists of characters A through Z (uppercase ONLY), numerals 0 through 9, space, and any other character found on a standard keyboard. The following characters are accepted:

! @ # \$ % ^ & * () - _ = + [{] } \ | ; : ' " , < . > / ? ` ~

Generally, the numeric data class is reserved for a data element used as an integer. It may also include a data element used as a sequencer (e.g., a line number).

Generally, any identifier or code is classed as alphanumeric. Note that this would include an identifier or code that may be required to be reported as all numerals.

Position:

Indicates the beginning and ending position, respectively, of the reported data element within the 80-character record.

Designation:

Indicates the reporting requirement as follows:

- M** = Mandatory. A value conforming to the listed class is required in all filing scenarios.
- C** = Conditional. A value conforming to the listed class may or may not be required for a particular filing scenario. The usage notes will describe the specific cases in which the data element is required or not allowed to be reported.
- O** = Optional. A value conforming to the listed class will be conditionally accepted if provided. An optional data element may be subject to validation, however.

Description:

Defines the data element and provides a further description of how it is to be reported. May include a list of acceptable values, an exception or further specification of the data class, and/or various rules regarding format, justification, and truncation.

Note:

Points to a further discussion regarding the reporting of the particular data element.
